Hi! Joe here, and I'm going to show you just how easy it is to install the Flex-C Trac system, step-by-step.

1. Draw the desired curve on the floor.

2. Then, shape the Flex-C Trac to match the pattern you've drawn.

3. If you like, apply masking tape along one side to hold the curve while you install the screws.

4. Begin at one end of the curve and install self-tapping screws into the side of the Flex-C Trac.

5. To match the curve to a top track, just turn the track over and match a second piece of track to it. Secure it with screws like the first piece.

6. Anchor the Flex-C Trac to the floor and plumb up the top and bottom layout.

7. Install the studs as you normally would. For tighter curves, use more studs to help the wall board bend more smoothly.

Continued
On the six inch wide Flex-C Trac, hammer down the tabs to secure the curve.

This special locking tab works in jobs where the track will be installed flat on the ground. Where the track will span between anchoring points, screws are still required to secure the curve.

Some installers prefer screwing through the overlapping bottom plates to secure the curve.

Flex-C Trac can be easily cut to length with tin snips.

Or, some installers prefer cutting Flex-C Trac with a chop saw.

Just overlap and screw the Flex-C Trac to get longer lengths.

This Flex-C Trac saves me so much time I can get on with my other chores!

...of course, use all normal precautions to protect eyes and yourself when operating power equipment.

And that's all there is to it!
